

List of known bugs:

1. We do not take into account time zones when creating events in the DB, this results in an event that is created on the last day of the month being logged as the first day of the next month.
2. We only query the current month for all the events in that month, if the user changes months that month's events do not show up.
3. If the console log is open, you cannot create events / click the plus button.
4. Passwords are not hashed with a salt. They are stored as plaintext.
5. If a user tries to sign up for an event that they are already signed up for there is an error from the backend.
6. If a user signs up for an event, there is no feedback that they are signed up. The modal does not close.
7. If you type in the wrong password in the admin_password field, it creates the account and you have no idea whether or not it worked (until you log in that is).
8. Sometimes when you delete an event, you have to refresh the page for it to change the state. Unsure what causes this.
9. Sometimes when you delete an event, all the events disappear. When you refresh the page, the undeleted events will load again.
